---

In order to use your Authorize.net enabled software but with Quantum using the Auth.net emulation method, you should follow this steps:

1. You must change in your application the Post URL (the URL of your gateway) from <https://secure.authorize.net/gateway/transact.dll> to [https://secure.quantumgateway.com/cgi/authnet\\_aim.php](https://secure.quantumgateway.com/cgi/authnet_aim.php)
2. You must use your Quantum gateway login id as your username
3. For the Transaction Key, you must use your Restriction Key. If you don't have it, you can easily generate it by login into your Quantum Gateway admin panel and going to the Processing settings area.  
Scroll down until to see the "Restriction Key" area. Click the generate button, check the "Use restriction key" box, and finally click the UPDATE button. That is your new restriction key (Transaction Key).

You must be aware that Quantum Gateway's Authorize.net emulation mode is not Authorize.net. It will provide to the basic functionality in order to process your payments. But it doesn't have all the features from Authorize.net nor from Quantum Gateway.

In order to check a comparison between the different integration methods of Quantum, please check: [http://www.quantumgateway.com/view\\_developer.php?Cat1=9](http://www.quantumgateway.com/view_developer.php?Cat1=9)

Quantum Gateway doesn't use a TEST URL. In order to test your application you should use the LIVE URL ([https://secure.quantumgateway.com/cgi/authnet\\_aim.php](https://secure.quantumgateway.com/cgi/authnet_aim.php) ) in your application but with test data stated at [http://www.quantumgateway.com/test\\_data.php](http://www.quantumgateway.com/test_data.php)
